Density-Based Clustering

Most of the traditional clustering techniques, such as k-means, hierarchical and fuzzy clustering, can be used to group data without supervision.

However, when applied to tasks with arbitrary shape clusters, or clusters within cluster, the traditional techniques might be unable to achieve good results. That is, elements in the same cluster might not share enough similarity or the performance may be poor. Additionally, Density-based Clustering locates regions of high density that are separated from one another by regions of low density. Density, in this context, is defined as the number of points within a specified radius.

In this section, the main focus will be manipulating the data and properties of DBSCAN and observing the resulting clustering.

Import the following libraries:

numpy as np

DBSCAN from sklearn.cluster

make blobs from sklearn.datasets.samples generator

StandardScaler from sklearn.preprocessing

matplotlib.pyplot as plt

Remember %matplotlib inline to display plots

```
[1]: # Notice: For visualization of map, you need basemap package.

# if you dont have basemap install on your machine, you can use the following

→ line to install it

# !conda install -c conda-forge basemap==1.1.0 matplotlib==2.2.2 -y

# Notice: you maight have to refresh your page and re-run the notebook after

→ installation
```

```
[2]: import numpy as np
  from sklearn.cluster import DBSCAN
  from sklearn.datasets.samples_generator import make_blobs
  from sklearn.preprocessing import StandardScaler
  import matplotlib.pyplot as plt
  %matplotlib inline
```

```
!conda install -c conda-forge basemap==1.1.0 matplotlib==2.2.2
```

Solving environment: failed

PackagesNotFoundError: The following packages are not available from current channels:

- basemap==1.1.0

and use the search bar at the top of the page.

0.0.1 Data generation

The function below will generate the data points and requires these inputs:

centroidLocation: Coordinates of the centroids that will generate the random data.

Example: input: [[4,3], [2,-1], [-1,4]]

numSamples: The number of data points we want generated, split over the number of centroids (# of centroids defined in centroidLocation)

Example: 1500

cluster Deviation: The standard deviation between the clusters. The larger the number, the further the spacing.

Example: 0.5

Use createDataPoints with the 3 inputs and store the output into variables X and y.

```
[4]: X, y = createDataPoints([[4,3], [2,-1], [-1,4]] , 1500, 0.5)
```

0.0.2 Modeling

DBSCAN stands for Density-Based Spatial Clustering of Applications with Noise. This technique is one of the most common clustering algorithms which works based on density of object. The whole idea is that if a particular point belongs to a cluster, it should be near to lots of other points in that cluster.

It works based on two parameters: Epsilon and Minimum Points

Epsilon determine a specified radius that if includes enough number of points within, we call it dense area

minimumSamples determine the minimum number of data points we want in a neighborhood to define a cluster.

```
[5]: epsilon = 0.3
    minimumSamples = 7
    db = DBSCAN(eps=epsilon, min_samples=minimumSamples).fit(X)
    labels = db.labels_
    labels
```

[5]: array([0, 1, 1, ..., 2, 2, 1])

0.0.3 Distinguish outliers

Lets Replace all elements with 'True' in core_samples_mask that are in the cluster, 'False' if the points are outliers.

```
[6]: # Firts, create an array of booleans using the labels from db.
core_samples_mask = np.zeros_like(db.labels_, dtype=bool)
core_samples_mask[db.core_sample_indices_] = True
core_samples_mask
```

```
[6]: array([ True, True, True, ..., True, True, True])
```

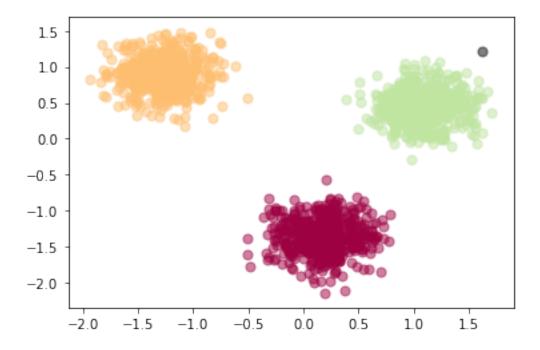

```
[7]: # Number of clusters in labels, ignoring noise if present.

n_clusters_ = len(set(labels)) - (1 if -1 in labels else 0)
```

```
n_clusters_
 [7]: 3
 [8]: # Remove repetition in labels by turning it into a set.
      unique_labels = set(labels)
      unique_labels
 [8]: {-1, 0, 1, 2}
     0.0.4 Data visualization
 [9]: # Create colors for the clusters.
      colors = plt.cm.Spectral(np.linspace(0, 1, len(unique_labels)))
[10]: # Plot the points with colors
      for k, col in zip(unique_labels, colors):
          if k == -1:
              # Black used for noise.
              col = 'k'
          class_member_mask = (labels == k)
          # Plot the datapoints that are clustered
          xy = X[class_member_mask & core_samples_mask]
          plt.scatter(xy[:, 0], xy[:, 1],s=50, c=[col], marker=u'o', alpha=0.5)
          # Plot the outliers
```

plt.scatter(xy[:, 0], xy[:, 1],s=50, c=[col], marker=u'o', alpha=0.5)

xy = X[class_member_mask & ~core_samples_mask]

0.1 Practice

To better underestand differences between partitional and density-based clusteitng, try to cluster the above dataset into 3 clusters using k-Means.

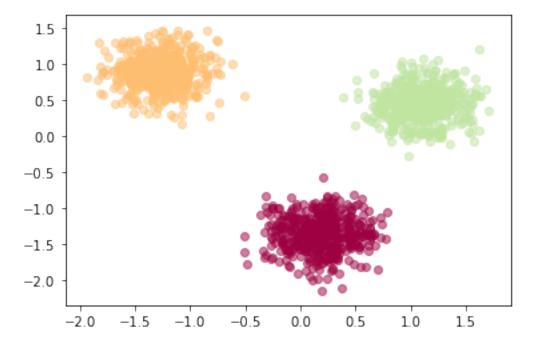

Notice: do not generate data again, use the same dataset as above.

^{&#}x27;c' argument looks like a single numeric RGB or RGBA sequence, which should be avoided as value-mapping will have precedence in case its length matches with 'x' & 'y'. Please use a 2-D array with a single row if you really want to specify the same RGB or RGBA value for all points.

^{&#}x27;c' argument looks like a single numeric RGB or RGBA sequence, which should be avoided as value-mapping will have precedence in case its length matches with 'x' & 'y'. Please use a 2-D array with a single row if you really want to

specify the same RGB or RGBA value for all points.

'c' argument looks like a single numeric RGB or RGBA sequence, which should be avoided as value-mapping will have precedence in case its length matches with 'x' & 'y'. Please use a 2-D array with a single row if you really want to specify the same RGB or RGBA value for all points.

Double-click here for the solution.

Weather Station Clustering using DBSCAN & scikit-learn

DBSCAN is specially very good for tasks like class identification on a spatial context. The wonderful attribute of DBSCAN algorithm is that it can find out any arbitrary shape cluster without getting affected by noise. For example, this following example cluster the location of weather stations in Canada. <Click 1> DBSCAN can be used here, for instance, to find the group of stations which show the same weather condition. As you can see, it not only finds different arbitrary shaped clusters, can find the denser part of data-centered samples by ignoring less-dense areas or noises.

let's start playing with the data. We will be working according to the following workflow: 1. Loading data - Overview data - Data cleaning - Data selection - Clusteing

0.1.1 About the dataset

Environment Canada Monthly Values for July - 2015

Name in the table

Meaning

Stn_Name

Station Name</font Lat Latitude (North+, degrees) Long Longitude (West - , degrees) Prov Province TmMean Temperature (°C) DwTmDays without Valid Mean Temperature \mathbf{D} Mean Temperature difference from Normal (1981-2010) (°C) TxHighest Monthly Maximum Temperature (°C) DwTxDays without Valid Maximum Temperature Tn Lowest Monthly Minimum Temperature (°C) DwTnDays without Valid Minimum Temperature Snowfall (cm) DwSDays without Valid Snowfall S%NPercent of Normal (1981-2010) Snowfall Total Precipitation (mm) DwPDays without Valid Precipitation

P%N

Percent of Normal (1981-2010) Precipitation

S G

Snow on the ground at the end of the month (cm)

Ρd

Number of days with Precipitation 1.0 mm or more

BS

Bright Sunshine (hours)

DwBS

Days without Valid Bright Sunshine

BS%

Percent of Normal (1981-2010) Bright Sunshine

HDD

Degree Days below 18 °C

CDD

Degree Days above 18 °C

Stn_No

Climate station identifier (first 3 digits indicate drainage basin, last 4 characters are for sorting alphabetically).

0.1.5 4-Visualization

Visualization of stations on map using basemap package. The matplotlib basemap toolkit is a library for plotting 2D data on maps in Python. Basemap does not do any plotting on it's own, but provides the facilities to transform coordinates to a map projections.

Please notice that the size of each data points represents the average of maximum temperature for each station in a year.

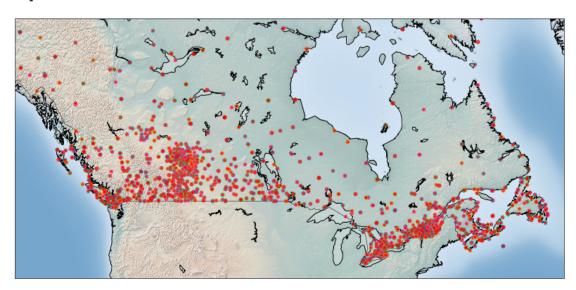

```
[15]: from mpl_toolkits.basemap import Basemap
      import matplotlib.pyplot as plt
      from pylab import rcParams
      %matplotlib inline
      rcParams['figure.figsize'] = (14,10)
      llon=-140
      ulon=-50
      llat=40
      ulat=65
      pdf = pdf[(pdf['Long'] > llon) & (pdf['Long'] < ulon) & (pdf['Lat'] > llat)
       →&(pdf['Lat'] < ulat)]</pre>
      my_map = Basemap(projection='merc',
                   resolution = 'l', area_thresh = 1000.0,
                   llcrnrlon=llon, llcrnrlat=llat, #min longitude (llcrnrlon) and
       \rightarrow latitude (llcrnrlat)
                   urcrnrlon=ulon, urcrnrlat=ulat) #max longitude (urcrnrlon) and_
       \rightarrow latitude (urcrnrlat)
      my_map.drawcoastlines()
      my_map.drawcountries()
```

/home/jupyterlab/conda/envs/python/lib/python3.6/site-packages/ipykernel_launcher.py:20: MatplotlibDeprecationWarning:

The dedent function was deprecated in Matplotlib 3.1 and will be removed in 3.3. Use inspect.cleandoc instead.

0.1.6 5- Clustering of stations based on their location i.e. Lat & Lon

DBSCAN form sklearn library can runs DBSCAN clustering from vector array or distance matrix. In our case, we pass it the Numpy array Clus_dataSet to find core samples of high density and expands clusters from them.

```
[16]: from sklearn.cluster import DBSCAN
      import sklearn.utils
      from sklearn.preprocessing import StandardScaler
      sklearn.utils.check random state(1000)
      Clus_dataSet = pdf[['xm','ym']]
      Clus dataSet = np.nan to num(Clus dataSet)
      Clus_dataSet = StandardScaler().fit_transform(Clus_dataSet)
      # Compute DBSCAN
      db = DBSCAN(eps=0.15, min_samples=10).fit(Clus_dataSet)
      core_samples_mask = np.zeros_like(db.labels_, dtype=bool)
      core_samples_mask[db.core_sample_indices_] = True
      labels = db.labels_
      pdf["Clus_Db"]=labels
      realClusterNum=len(set(labels)) - (1 if -1 in labels else 0)
      clusterNum = len(set(labels))
      # A sample of clusters
      pdf[["Stn_Name","Tx","Tm","Clus_Db"]].head(5)
```

```
「16]:
                      Stn Name
                                       Tm Clus Db
                                  Tx
                     CHEMAINUS 13.5 8.2
     0
                                                0
     1
       COWICHAN LAKE FORESTRY 15.0 7.0
                                                0
     2
                 LAKE COWICHAN 16.0
                                     6.8
                                                0
     3
           DUNCAN KELVIN CREEK
                               14.5
                                     7.7
                                                0
     4
             ESQUIMALT HARBOUR 13.1 8.8
                                                0
```

As you can see for outliers, the cluster label is -1

```
[17]: set(labels)
```

```
[17]: {-1, 0, 1, 2, 3, 4}
```

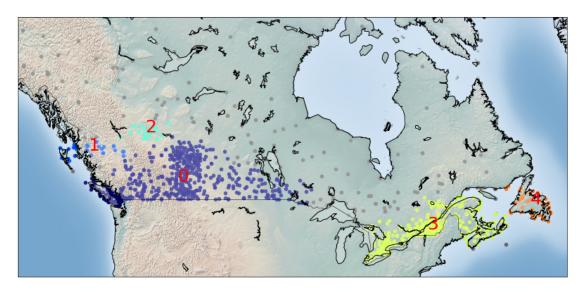

0.1.7 6- Visualization of clusters based on location

Now, we can visualize the clusters using basemap:

```
[18]: from mpl_toolkits.basemap import Basemap import matplotlib.pyplot as plt from pylab import rcParams %matplotlib inline
```

```
rcParams['figure.figsize'] = (14,10)
my_map = Basemap(projection='merc',
            resolution = 'l', area_thresh = 1000.0,
            llcrnrlon=llon, llcrnrlat=llat, #min longitude (llcrnrlon) and and
 \rightarrow latitude (llcrnrlat)
            urcrnrlon=ulon, urcrnrlat=ulat) #max longitude (urcrnrlon) and_
 \rightarrow latitude (urcrnrlat)
my_map.drawcoastlines()
my_map.drawcountries()
#my map.drawmapboundary()
my_map.fillcontinents(color = 'white', alpha = 0.3)
my_map.shadedrelief()
# To create a color map
colors = plt.get_cmap('jet')(np.linspace(0.0, 1.0, clusterNum))
#Visualization1
for clust_number in set(labels):
    c=(([0.4,0.4,0.4]) if clust number == -1 else colors[np.int(clust_number)])
    clust_set = pdf[pdf.Clus_Db == clust_number]
    my_map.scatter(clust_set.xm, clust_set.ym, color =c, marker='o', s= 20,__
 \rightarrowalpha = 0.85)
    if clust number != -1:
        cenx=np.mean(clust_set.xm)
        ceny=np.mean(clust_set.ym)
        plt.text(cenx,ceny,str(clust_number), fontsize=25, color='red',)
        print ("Cluster "+str(clust_number)+', Avg Temp: '+ str(np.
 →mean(clust_set.Tm)))
/home/jupyterlab/conda/envs/python/lib/python3.6/site-

```

Cluster 4, Avg Temp: -7.769047619047619

0.1.8 7- Clustering of stations based on their location, mean, max, and min Temperature

In this section we re-run DBSCAN, but this time on a 5-dimensional dataset:

```
[19]: from sklearn.cluster import DBSCAN
      import sklearn.utils
      from sklearn.preprocessing import StandardScaler
      sklearn.utils.check_random_state(1000)
      Clus_dataSet = pdf[['xm','ym','Tx','Tm','Tn']]
      Clus_dataSet = np.nan_to_num(Clus_dataSet)
      Clus_dataSet = StandardScaler().fit_transform(Clus_dataSet)
      # Compute DBSCAN
      db = DBSCAN(eps=0.3, min_samples=10).fit(Clus_dataSet)
      core_samples_mask = np.zeros_like(db.labels_, dtype=bool)
      core_samples_mask[db.core_sample_indices_] = True
      labels = db.labels_
      pdf["Clus_Db"]=labels
      realClusterNum=len(set(labels)) - (1 if -1 in labels else 0)
      clusterNum = len(set(labels))
      # A sample of clusters
      pdf[["Stn_Name","Tx","Tm","Clus_Db"]].head(5)
```

```

0.2 Want to learn more?

IBM SPSS Modeler is a comprehensive analytics platform that has many machine learning algorithms. It has been designed to bring predictive intelligence to decisions made by individuals, by groups, by systems – by your enterprise as a whole. A free trial is available through this course, available here: SPSS Modeler.

Also, you can use Watson Studio to run these notebooks faster with bigger datasets. Watson Studio is IBM's leading cloud solution for data scientists, built by data scientists. With Jupyter

notebooks, RStudio, Apache Spark and popular libraries pre-packaged in the cloud, Watson Studio enables data scientists to collaborate on their projects without having to install anything. Join the fast-growing community of Watson Studio users today with a free account at Watson Studio
